

## Every penny counts with AXIS VeriSecure

Capita Software Services have recently extended their card fraud protection measures around internet payments with the addition of AXIS VeriSecure.

This incorporates the latest safeguards from Visa (Verified by Visa) and MasterCard (MasterCard SecureCode) and means that cardholders will be authenticated when making a payment, by simply entering a password. The password will be validated against one they have previously chosen when registering for the service with their own card issuer (bank or building society).

The password capture and validation takes place within the card issuer's highly secure system, which is accessed seamlessly via the AXIS VeriSecure MPI (Merchant Plug-In), a module created by Capita Software Services and accredited by both Visa and MasterCard.

London Borough of Lambeth were the first Local Authority to implement this system in June 2006. A growing number of our existing customers have since joined them by introducing this increased security checking to their payment solutions.

London Borough of Lambeth has recently introduced AXIS VeriSecure into our existing Internet Payment solution. Given our long-standing partnership with Capita Software Services, we see the inclusion of this additional validation around card processing as helping to ensure that we continue to take all steps possible to help guard against card fraud and disputed payments. We are also keen that our citizens are assured when making payments via our website that the transaction is taking place using the highest standards of security available.

Paul Denham, Contract Manager, Lambeth

“Capita is committed to ensure that the levels of card fraud protection within our AXIS product suite continue to adopt all means possible to help guard our customers and their users against card fraud. The addition of this new facility is a measure of our commitment in this area.”

David Lockie, Associate Director, AXIS Payment Management, Capita Software Services
